

**Ex1.**

Write a Java console program that:

Asks the user to enter their weight (kg) and height (meters) via the keyboard.

Calculates the BMI using the formula:  $BMI = \text{weight} / (\text{height} * \text{height})$

Prints the BMI value rounded to 2 decimal places.

Prints the corresponding BMI category to the user.

**Ex2.**

Create a package name model. Inside it create a class Book contain fields: title (String), author (String), price (double).

In the Main class, prompt the user to enter the number of books they want to input.

Then, use a loop to collect the information for each book from user input.

As soon as the input for a book is completed, immediately display that book's information before proceeding to the next one.
