

Create a Java program to support the process of raising tickets to IT departments.

First, create a class named Ticket that represents a support ticket in an IT helpdesk system. The Ticket class must contain private fields including id (int), title (String), reporterName (String), priority (Priority), and status (Status).

The Priority and Status fields must use Enum types.

Define Priority with values LOW, MEDIUM, HIGH,

Define Status with values OPEN, IN_PROGRESS, RESOLVED.

Provide a no-argument constructor and a parameterized constructor that initializes all fields. When using the parameterized constructor, status should always be set to Status.OPEN by default

Additionally, create a display() method that prints all ticket information to the console in a readable format.

After completing the Ticket class, create a Main class containing the main method to run the program. In the main method, use the Scanner class to read input from the keyboard.

List of function support should be as follow:

=== IT SUPPORT TICKET SYSTEM ===

1. Create new ticket
2. View all tickets
3. Update ticket status
4. Delete ticket
5. Filter by priority
0. Exit

Enter your choice:

When add new ticket, for priority property, display the available options (LOW, MEDIUM, HIGH) and keep prompting until a valid value is entered, and store each ticket in an ArrayList<Ticket>.
